

## Risk Rating Explained

### Extreme Risk

#### Very Hazardous

One or more imminent electrical fire hazards have been identified. Should risk be described as extreme, immediate action should be taken to eliminate the identified hazard(s).

### High Risk

#### Not Acceptable

One or more electrical issues have been identified that do not comply with the Canadian Electrical Code at present nor as it existed at the time of the installation. While the concerns do not seem to be of imminent peril they should be corrected ASAP.

### Medium Risk

#### Acceptable

The electrical system appears to comply with code that was applicable at time the electrical installation was done. Electrical wiring, both old and new appears to be in satisfactory condition.

### Low Risk

#### Acceptable plus additional upgrades

Not only Medium Risk, but premises have been upgraded substantially to safety standards of today. This includes GFCI protection of receptacles in wet locations and hard-wired smoke alarms.

Note: Low Risk presents an excellent list of upgrades, however no premises built before 1995 will likely have all of these upgrades present today.
